PART IV: QUICK REFERENCE

- [16. Checklists](#)

PART I: FOUNDATIONS

1. Overview & Team Roles

What SUMO Does

SUMO provides full-service dex market making for token launches on Solana. Our services include:

- Token launch and deployment
- Supply control through strategic accumulation
- 24/7 automated trading bot management
- Manual trading and chart management
- Client dashboard and analytics

Team Roles

Team Member	Responsibilities
Mawr	Business development, client relations, sales
Kodak	Operations/systems, trade floor management, dashboard setup, analytics, client communications
Lee	Bundle execution, wash process, technical operations, collateral management
Jam	Trading software setup, bot management, balance tracking, manual trading, client communication, treasury growth and chart strategy comms/organization

Key Principles

- Everyone should have a narrow set of responsibilities and never feel overwhelmed.
- The more we can set exact expectations with clients, the better.
- Client comms speed and urgency matter - always.

2. Security Philosophy

Why Intermediary Wallets Exist

Intermediary wallets create a security checkpoint between treasury funds and final destination:

- Obfuscates direct exposure of treasury wallet addresses to clients
- Creates audit trail for every outbound transaction
- Allows verification step before funds leave our control
- Limits blast radius if a client wallet is compromised or incorrect

PRINCIPLE: Never send large amounts directly from treasury to external wallets. Always route through intermediary.

Why Test Transactions Are Mandatory

Test TXs catch mistakes before they become catastrophic:

- Wrong wallet address = small loss, not total loss
- Network issues get detected on small amounts
- Client can confirm receipt before full transfer
- Creates clear handoff point with client acknowledgment

PRINCIPLE: The 2 minutes spent on a test TX can save hours of panic and potentially unrecoverable funds.

Why Private Key Handling Is Strict

PKs are the master keys to wallets. Leaked PKs = total loss:

- Group chats can be screenshotted, forwarded, or hacked
- Not everyone in a group chat should have wallet access
- Once a PK is exposed, there's no way to know if it's been copied
- Only the decision maker should receive PKs - verify identity first

PRINCIPLE: Treat PKs like nuclear launch codes. Private DM to verified decision maker. Never in groups.

Why Starting Balance Must Be Pinned

The starting balance is the baseline for ALL fee calculations:

- Determines what counts as profit vs. return of principal
- Client disputes often come from unclear starting points
- Pinned message creates undeniable record both parties can reference
- Prevents 'he said / she said' situations at cashout

Re-Fill Clause

When additional funds are injected into MM after the initial starting balance:

- Document each injection with date, amount, and source in the spreadsheet
- Pin updated total balance in MM chat after each re-fill
- Re-fills add to the principal baseline (not treated as profit)
- At cashout: Total Principal = Starting Balance + All Re-Fills

PRINCIPLE: If it's not communicated or pinned, it didn't happen. Pin starting balance immediately after launch and dashboard setup.

3. Rules & Red Lines

These are absolute rules. No exceptions. No judgment calls. Violating these puts client funds, team reputation, and potentially legal standing at risk.

Wallet & Key Security

- ⊘ NEVER send private keys in group chats - Private DM to verified decision maker ONLY
- ⊘ NEVER import or trade from the Deployer wallet unless doing final cashout
- ⊘ NEVER send large transfers without test TX first
- ⊘ NEVER share treasury wallet addresses with clients - Use intermediary wallets

Trading Operations

- ⊘ NEVER leave newly injected treasury liquidity in a chart for over an hour if client is at a loss - 15-30 min max
- ⊘ NEVER counter-trade our own wallets - Add all tertiary wallets to peanuts black list
- ⊘ NEVER activate Peanuts profiles unless ready - They charge on activation
- ⊘ NEVER let bots run unmonitored for extended periods - Check every 15 min minimum
- ⊘ NEVER sell below bundle price when clipping supply into launch volume

Client & Financial

- ⊘ NEVER calculate fees without subtracting starting balance first
- ⊘ NEVER skip pinning the starting balance
- ⊘ NEVER process cashout without client confirming test TX - Wait for explicit confirmation
- ⊘ NEVER promise specific returns or timelines, we control strategy execution, not the market or organic volume

Communication

- ⊘ NEVER go offline without notifying client and documenting bot state
- ⊘ NEVER ignore client messages for more than 5 minutes during active trading
- ⊘ NEVER discuss one client's specifics with another client

→ See: [Section 2: Security Philosophy](#) — for the reasoning behind these rules

4. Fee Structure & Revenue Model

Daily Minimum Fees

Service Level	Daily Minimum
Launch Day (includes MM + Dev/Launch)	\$5,000/Day + 1% of Token Supply
24/7 Live Trading Coverage	\$850/Day

Launch Day Pricing Breakdown

The \$5K Launch Day fee is split as follows (useful for pricing discounts):

- **60% Launch Income (\$3,000)** — Dev/deployment, bundle execution, wash process
- **40% MM Income (\$2,000)** — Dashboard setup, bot configuration, day 1 trading

This breakdown allows for targeted discounts without reducing each team's revenue disproportionately.

Liquidation Fees

Fee Type	Amount
Cashed-Out Token Liquidations	10%

The Core Fee Rule

RULE: 10% of liquidations IN EXCESS OF STARTING BALANCE (initial collateral + any re-fills) OR the Daily Minimum - whichever is GREATER on a given day.

Fee Calculation Formula:

Profit = Final Balance - Starting Balance (initial + re-fills)

Liquidation Fee = 10% of Profit (only if profit exists)

Final Fee = MAX(Liquidation Fee, Daily Minimum)

Example 1: Liquidation Fee Applies (High Profit)

- Service: 24/7 Trading Coverage(\$850 daily min)
- Starting Balance: 50 SOL (~\$6,500 at \$130/SOL)
- Final Balance at Cashout: \$46,500

- Profit: $\$46,500 - \$6,500 = \$40,000$
- Liquidation Fee: $10\% \times \$40,000 = \$4,000$
- **Our Fee: \$4,000** (liquidation fee > \$850 daily min)

Example 2: Daily Minimum Applies (Low Profit)

- Service: 24/7 Trading Coverage (\$850 daily min)
- Starting Balance: 90 SOL (~\$11,500)
- Final Balance at Cashout: \$16,500
- Profit: $\$16,500 - \$11,500 = \$5,000$
- Liquidation Fee: $10\% \times \$5,000 = \500
- **Our Fee: \$850** (\$850 daily min > \$500 liquidation fee)

Example 3: With Re-Fill

- Starting Balance: \$6,500
- Re-Fill Day 5: +\$3,000 injected
- Total Principal: $\$6,500 + \$3,000 = \$9,500$
- Final Balance at Cashout: \$49,500
- Profit: $\$49,500 - \$9,500 = \$40,000$
- **Our Fee: \$4,000** (10% of \$40K profit)

Daily Fee Collection Schedule

DAILY AT 8PM EST: Collect Daily Minimum Fees from active projects, process pending cashouts, update records, process team payroll.

Income & Expense Tracking

ALL MM income and expense transactions must be recorded in the master spreadsheet:

- Daily fees collected
- Liquidation fees
- Team payroll
- Operational expenses
- Launch income

 **SPREADSHEET** [LINK](#)

5. Incident Response Protocol

When things go wrong, follow these protocols. Don't improvise. Don't panic. Execute the checklist.

Bot Failure

SYMPTOMS:

Bots stopped, no counter-trades executing, wallet errors

IMMEDIATE ACTIONS:

1. Check Peanuts dashboard - is profile still active?
2. Check wallet SOL balances - are they depleted?
3. Restart profile if needed
4. Notify client: 'Experiencing brief technical issue, monitoring now'

ESCALATE IF: Bots won't restart after 10 min, or issue is unknown

Wrong Wallet Sells

SYMPTOMS:

Counter-trading own wallets, unexpected sells

IMMEDIATE ACTIONS:

1. PAUSE all bots immediately
2. Check wallet exclusion list - are all tertiary wallets added?
3. Verify which wallets sold and calculate impact
4. Add missing wallets to exclusion list
5. Document the incident and SOL impact
6. Resume bots only after verification

ESCALATE IF: Significant treasury loss (>5 SOL)

Chart Nukes (Major Dump)

SYMPTOMS:

Price drops 50%+, large organic sells in notification channel, or panic in the chat

IMMEDIATE ACTIONS:

1. DO NOT panic buy immediately
2. Assess: Is this organic selling or something else?
3. Check: Are our wallets secure? Any unauthorized sells?
4. Communicate with client: 'Seeing heavy selling, monitoring closely'
5. Come up with a strategy – if we have heavy treasury, we should bid the chart up slowly to healthy levels. Set a budget, and do not continue to burn treasury quote beyond the projects means.

ESCALATE IF: Signs of exploit, unauthorized wallet activity

Funds Misrouted

SYMPTOMS:

Sent to wrong wallet, funds not arriving

IMMEDIATE ACTIONS:

1. STOP all pending transactions immediately
2. Verify transaction hash - where did funds actually go?
3. If sent to wrong OUR wallet: recoverable, document and retrieve
4. If sent to wrong EXTERNAL wallet: assess if recoverable
5. Document everything with screenshots and TX hashes
6. Notify client immediately with honest assessment

ESCALATE IMMEDIATELY: Any funds sent to unknown external wallet

When to Pause Everything

FULL STOP CONDITIONS: Any of these = pause all operations immediately

- Signs of wallet compromise or unauthorized transactions
- Discovery of bug in our trading setup
- Client requests immediate halt
- Any situation where continuing could make things worse

Post-Incident

1. Document everything while fresh
2. Calculate exact financial impact
3. Communicate honestly with client
4. Determine if SUMO covers the loss (our error) or not (market conditions or their error)
5. Update this manual if new failure mode discovered

Treasury Loss (Passive Bleed)

SYMPTOMS:

Client passively losing treasury. Two balance updates in a row where SOL is down. No obvious external dump or attack.

DIAGNOSIS:

6. Is volume bot running? (Volume bot costs treasury over time)
7. Are peanut settings misconfigured?
8. Check trading logs - are transactions failing?
9. Is sell pressure from externals outpacing our collection?

FIX:

10. Reduce or pause volume bot
11. Adjust token sell/buy strategy to counter volume bot drain
12. Increase slippage tolerance if txns are failing
13. Review peanut config and fix any misconfigurations

Quick Response Flowchart

Use this flowchart to quickly identify and respond to incidents:

STEP 1: IDENTIFY THE INCIDENT

What's happening? Bots stopped? Chart nuked? Wrong sells? Funds missing?

STEP 2: STOP & ASSESS

PAUSE bots if needed • DON'T panic trade • Check wallet security

STEP 3: COMMUNICATE

Notify client: "Experiencing issue, investigating now" — Brief, calm, professional

STEP 4: EXECUTE PROTOCOL

Follow the specific checklist for your incident type (see above)

STEP 5: ESCALATE IF NEEDED

Can't resolve in 10 min? Unknown issue? Treasury loss >5 SOL? → ESCALATE

FULL STOP CONDITIONS: Signs of wallet compromise • Bug in trading setup • Client requests halt • Situation could get worse

PAR II: CLIENT LIFECYCLE

6. Phase 1: Business Development

Sales Process

1. Sales Call with potential client
2. Fill Out Token Launch Specifications Doc for the Project
3. Send a Wallet Address for Launch Collateral (SOL) to be Sent to
4. Hand off to launch dev for Launch Preparation

Token Launch Specifications Doc

Capture the following from the client:

- Target MC for bundle
- Desired supply control percentage
- Launch date/time preferences
- Launch platform (PumpFun, Meteora, etc.)
- Any specific requirements or constraints
- Client wallet addresses for cashouts
- Communication preferences (Telegram handle)
- Whether they want to lock any % of supply

→ [See: Section 13: Client Communications Templates](#) — for standard onboarding message format

Collateral Requirements by Launch Type

NOTE: All estimates assume SOL @ ~\$130. Adjust proportionally based on current SOL price. The \$5K fee buffer = ~38 SOL at this price.

PumpFun Bundle (50% - 79.1% Supply Control)

Same wallet setup and launch plan applies across this range. Supply % determines bundle cost.

For 79.1% Supply:

- Bundle cost: 107 SOL
- Starting MM Balance: ~15 SOL

- Starting MC: \$49,556.08 USD

For 50% Supply:

- Bundle cost: 43 SOL
- Starting MM Balance: 10.44 SOL
- Starting MC: \$12,019.93 USD (at \$122.60/SOL)

Fee Structure

Our \$5K launch fee can be handled two ways:

Option A: Fee Buffered in Collateral (Default)

Fee is built into SOL collateral. We withdraw fee from treasury over time.

Supply %	Bundle Cost	Total Collateral (incl. \$5K fee buffer)
79.1%	107 SOL	~148 SOL
50%	43 SOL	~84 SOL

*Fee buffer = ~41 SOL (\$5K at ~\$122/SOL)

Option B: Fee Paid Upfront (\$3K)

Client pays \$3K upfront in fiat/stables. Collateral = bundle cost only.

Supply %	Upfront Fee	SOL Collateral
79.1%	\$3,000	107 SOL
50%	\$3,000	43 SOL

7. Phase 2: Launch Preparation (Launch Dev)

Preparation Checklist

1. Read Token Launch Specifications Doc and Prepare Accordingly
2. Confirm launch date with Client and mark on team calendar
3. Cross-chain wash the collateral amount via debridge or rubic
4. Set up funding amounts for each wallet in a CSV (labeled for Trading/MM)
5. Fund wallets

→ [See: Section 13: Client Communications Templates](#) — for confirmation message format

Bundle Planning

1. Determine target MC for bundle
2. Calculate with pumpfun-planner.ts script (or equivalent for platform)
3. Decide wallet distribution for good-looking holder spread
 - For every 1 wallet to wash into, need 3 passthrough wallets with 0.07 SOL
 - Second wash likely necessary to remove time nodes
 - Can re-use same passthrough wallets for second wash
4. Set up lookup tables for the bundle (Token CA computed here)
5. Compute pool address based on CA
6. Set up lookup tables for washout

PumpFun Bundle Specifications

Parameter	Typical Value
Bundle Supply Control	76-79% (washes to ~75%)
Bundle Wallets	Dev + 7 (varies by setup)
Migration LP Lock	~20 SOL locked
Sumo Launch Fee	1% of token supply

Meteora Bundle Specifications

INSERT METEORA LAUNCH SPECIFICS HERE

Wash Timeline Options

- Quick: 3 min
- Longer: 15 min+
- Timeline depends on how organic client wants the chart to look, and whether client cares about bubblemaps time nodes.

Notification Channel Setup (Before CA)

1. Create new Telegram notification channel
2. Add Sumo bot as admin
3. Get channel ID (forward message to userInfoBot)
4. Set channel name: \$TICKER - Organic Trade Notifications
5. Set channel avatar as SUMO logo

8. Phase 3: Launch Execution

Pre-Launch (1H Minutes Before)

1. Get on Team Launch Call with client
2. Confirm Exact Deploy Timing
3. Get CA ready (and Pool ID for pumpfun, otherwise will need to grab Pool ID at launch from dexscreener)
4. Load seller (bundle) wallets into Phantom for manual selling
 - Higher numbered sellers in spreadsheet will have supply the longest (last to wash)
 - Use these wallets for manual selling into launch volume
5. Complete Pre-Launch Peanuts Setup

→ [See: Section 11: Trading Software \(Peanuts\) Guide](#) — for full Peanuts setup procedure

Token Deployment & Bundle

1. Deploy Token + Execute Bundle
2. Begin Wash - Communicate Exact ETA to Client + Team
3. Stay live on call during wash process

→ [See: Section 13: Client Communications Templates](#) — for wash ETA communication format

Supply Clipping Into Launch Volume

When pool is live (launched), clip supply into launch volume:

- Increase sell amount on high initial wicks
- Lower sell amount on low initial wicks
- Adjust dynamically based on volume
- If client is expecting lots of initial volume, prepare to collect hard

NEVER: Sell below bundle price when clipping supply.

Dashboard & Analytics Setup

1. Go to `app.sumo.trade/admin` (password `Admin2025!Secure#Token`)
2. Create project with CA, name, chain
3. Set password
4. Add Sumo Bot to project TG chat
5. Run `/setup <project_id>` in Telegram
6. Label all wallets (treasury > mm)
7. Label LP and deployer wallet
8. Link notification channel: `/link_notifications <project_id> <channel_id>`

VERIFY: Confirm Everything is Working 100% as Intended before proceeding.

Trading Software Setup (Peanuts)

1. Create token profile in Peanuts
2. Add CA and Pool ID
3. Import wallets for MM (EXCEPT Deployer)
4. Approve all MM (child) wallets
5. Add all tertiary wallets to exclusion list
6. Duplicate template strategies to profile
7. Go to profile settings and verify Pool ID
8. Start profile
9. Activate Counter-Trading Bots FIRST
10. Then activate Target Based Strategies
11. Turn on volume bundle as needed

IMPORTANT: Import ALL wallets EXCEPT the Deployer wallet. Only approve child/buyer wallets (others remain archived/blacklisted).

→ [See: Section 11: Trading Software \(Peanuts\) Guide](#) — for detailed profile management

→ [See: Section 12: Bot Configuration Reference](#) — for counter-trade and volume bot settings

Post-Bundle Actions

1. Immediately run Balance check once dashboard is set up and wallets are labelled
2. Manually Sell into Launch Volume (from Phantom, using higher-numbered seller wallets)
3. Message and Pin Starting Balance in MM Chat

→ [See: Section 3: Rules & Red Lines](#) — starting balance MUST be pinned - no exceptions

Client Expectations to Set

Communicate realistic expectations based on the specific launch type:

- Final supply control percentage after wash (varies by platform)
- Portion sold into launch volume with seller wallets (rough % supply amount)
- Amount locked in LP (platform-dependent)
- Typical ending supply control range after trading

NOTE: Specific numbers will vary between PumpFun, Meteora, and other platforms. Adjust communication accordingly.

→ [See: Section 13: Client Communications Templates](#) — for onboarding message with dashboard access

9. Phase 4: Active Trading

Core Principle: Always Have a Strategy

CRITICAL: ALWAYS have a clear trading strategy and communicate it effectively to the client. Never trade without a plan.

Your strategy should include:

- Current market assessment
- Target price ranges
- Bot settings rationale
- Entry/exit triggers
- Fallback plan if things don't go as expected

Daily Operations

- Have chart open at ALL times while on shift

- Be in VC at all times while on trader shift
- Monitor all bots - don't let them stop for extended periods
- Check wallet SOL balances regularly
- Respond to client questions promptly

→ [See: Section 14: Trader Shift Protocol](#) — for complete shift requirements and handoff procedures

Client Communication Rhythm

- Notify client when you come online
- Notify client when going offline
- Handle all cashout requests promptly
- Provide regular updates on treasury growth and trajectory
- Proactively share strategy updates, don't wait to be asked

→ [See: Section 13: Client Communications Templates](#) — for availability notifications and update formats

Bot Management

- Adjust bots per client requests or MM strategy
- Counter-sell typically 10-35%, can be adjusted to 15-50% or 20-70% for higher extraction
- Counter-buy typically at 5-15%, only increase beyond if we have budget to support with treasury
- Volume bot is BUDGET-BASED - set budget, it runs until depleted

→ [See: Section 12: Bot Configuration Reference](#) — for counter-trade settings and volume bot details

Trading Strategy Guidelines

- Let counter trade bots collect on volume
- Only buy on big dumps
- Don't let chart wick too high
- Aim for 30-40% collection of buy volume
- Add all tertiary wallets to avoid counter trading yourself

NEVER: leave newly injected treasury liquidity in a chart for over an hour if client is at a loss - 15-30 min max

→ [See: Section 5: Incident Response Protocol](#) — if something goes wrong during trading

Daily Fee Collection

DAILY AT 8PM EST: Collect Daily Minimum Fees, process cashouts, update records, process team payroll.

→ [See: Section 4: Fee Structure & Revenue Model](#) — for fee calculation rules and Fee Decision Flow

Shift Handoff

Before ending your shift:

- Notify client about current chart state
- Document current bot settings
- Note any issues or things to watch
- Provide info for the off period

→ [See: Section 14: Trader Shift Protocol](#) — for complete handoff checklist

10. Phase 5: Cashout & Offboarding

Cashout Types

- Final Cashout - Project ending, sell all supply
- Interim Cashout - Partial withdrawal, project continues
- Team's Own Money - Return original funds (NO FEE)

Final Cashout Process

1. Current Balance Check
2. Sell Down Supply
3. If PumpSwap: Claim Creator Fees
4. Calculate Fee (subtract starting balance first, then 10% or daily min)
5. CLIENT COMMS: Send breakdown (Sumo Fee, Client Profit)
6. CLIENT COMMS: Request client wallet for test TX
7. Upload ALL wallets + Deployer to pnuts
8. Create Intermediary Wallet
9. Send Test TX to Intermediary, verify
10. Send Full Balance to Intermediary
11. Verify all numbers
12. Send Test TX to Client Wallet, notify client
13. Wait for client confirmation
14. Notify client, send final payment
15. Confirm completion with client
16. Send Sumo fee to Treasury
17. Enter into Spreadsheet

→ [See: Section 4: Fee Structure & Revenue Model](#) — for Fee Decision Flow (subtract starting balance FIRST)

→ [See: Section 13: Client Communications Templates](#) — for cashout breakdown message format

→ [See: Section 2: Security Philosophy](#) — for why intermediary wallets and test TXs are mandatory

Hands-Off Options

When client requests to go hands-off, offer two options:

Option A: Liquidate Remaining Tokens

- Liquidate all tokens
- Final Cashout with 10% fee (or daily min)
- Follow standard Final Cashout Process

Option B: Send Private Keys

- Prepare all PKs in CSV file
- Send in PRIVATE DM only
- Only to confirmed decision maker

Once project is completed, stop peanut trade profile, and use /unlink in TG to unlink the sumo bot.

SECURITY: NEVER send PKs in group chats. Private DM to decision maker ONLY.

→ See: Section 3: Rules & Red Lines — PK handling is a RED LINE - no exceptions

PART III: REFERENCE MODULES

11. Trading Software (Peanuts) Guide

This section is referenced from: Phase 3 (Launch Execution) - Trading Software Setup

Profile Setup Procedure

1. Create token profile (after confirming w/ client token name)
2. Open newly created token profile
3. Add CA (Contract Address), Pool ID, and Quote Token address (Select “trade with native” if quote is SOL)
4. Import MM trading wallets only (child/buyer wallets)
5. Approve all MM (child/buyer) wallets (these are the wallets we are trading with)
6. After profile settings confirmed, save/create profile
7. Add all tertiary/external wallets to profile, then add them to the exclusion list (DO NOT APPROVE)
8. Duplicate template strategies to profile
9. Go to profile settings and verify Pool ID is imported
10. Start profile
11. Activate Counter-Trading Bots FIRST
12. Then activate Target Based Strategies
13. Turn on trading bundle as needed

Bot Activation Order

1. Counter-Trading Bots (activate FIRST)
2. Target Based Strategies
3. Volume Bots (as needed)

Wallet Import Rules

CRITICAL: Import ALL wallets EXCEPT the Deployer wallet.

- Add all tertiary wallets to avoid us counter trading ourselves
- Track hop wallets used for cashout under treasury inactive in dashboard

→ [See: Section 3: Rules & Red Lines](#) — deployer wallet exclusion is a RED LINE

Profile Management

- Don't activate profiles unless ready (peanuts charges on activation) and project is live
- Keep template strategies updated

12. Bot Configuration Reference

This section is referenced from: Phase 3 (Launch Execution), Phase 4 (Active Trading) - Bot Management

Counter Trade Bot

Setting	Details
Counter-Sell Range	Typically 15-50%, adjust with market cap and organic volume
Counter-Buy	Typically 5-15%, can and should be turned off to preserve treasury
Slippage Tolerance	Depends on volatility, but base should be 5%
Transaction Amount	Min: \$25, Max: \$15,000
Key Note	Counter trades must be tweaked INTENTIONALLY

Volume Bot (Trading Bundle)

IMPORTANT: Volume Bot is BUDGET-BASED. Set a budget and it runs until depleted.

Setting	Details
Type	Recurring, BUDGET-BASED
Behavior	Randomizes buys/sells relatively neutral
Target, 24H	Amount that gets added to volume over 24H period, depending on how much volume we or client want to run with
Single trade Bundle Time Interval	Can be compressed over specific timeframes, 1 minimum, usually 3-7 for maximum
Bundle Sum Randomization Spread	50%

Token Sell/Buy and Price Retention:

- Sell or Buy tokens in a necessary price range or time interval
- Can be used for protecting price floors or selling into highs

Manual Trading

- Use for creating ranging and market structure
- Execute quickly: 15-30 min max
- Stay within defined price range
- Don't cause big chart impact when selling

Wallet SOL Management

- Ensure wallets have sufficient SOL for gas
- Turn off wallets that run out of SOL
- Clear alert shows when balance insufficient

→ See: [Section 5: Incident Response Protocol](#) — if bots fail or wallets run out of SOL

13. Client Communications Templates

This section is referenced from: All Phases - Client touchpoints throughout the lifecycle

Onboarding Message

Send after dashboard and notification channel are set up:

"Hi Team, Token dashboard and trade notification channel access below:

 *Dashboard: https://app.sumo.trade/<project_name>*

 *Password: <project_password>*

 *Organic Trade Notifications Channel: <telegram_channel_link>*

Let me know if you need any assistance."

Trading Update Format

Include relevant mix of:

- Chart screenshot
- Current state explanation
- Strategy/plan with time horizon
- Ideal outcome
- Fallback plan

IMPORTANT: Address client's probable state of mind. Read the room. Custom comms for each situation.

Strategy Update Examples

✓ **RIGHT WAY:** Clear strategy with chart + specific targets

Scenario: *Chart is dipping, client might be worried*

[Chart screenshot attached]

There is more sell pressure than buy pressure, so I am guiding this lower to help establish a floor.

Ideally, that floor forms a double bottom around the \$40k MC level.

From there, we can work it higher and build a range between \$47k and \$53k MC.

⊗ **WRONG WAY:** Vague and unhelpful

Scenario: *Same situation as above*

Chart's fine, just watching it

Fee Collection Examples

✓ **RIGHT WAY:** Clear breakdown with token + amount

Just withdrew \$1,000 worth of \$LIFE from MM balance for the past 24h of trading

❌ WRONG WAY:Missing context

Withdrew 7.5 SOL

Cashout Breakdown Examples

✓ RIGHT WAY:Complete breakdown with all line items

Total Cashout: 408 SOL

10% MM + Dev Cut: 40.8 SOL

Extra \$500 for Dev Cut: 3.95 SOL

Total Fee: 44.7 SOL

Total Post-Fee Cashout: 363.3 SOL

❌ WRONG WAY:Missing breakdown

Sending you 363 SOL

Example Trader Comms Scripts Here: <https://t.me/+40Z0PIFtqmlIMTUx>

Communication Templates

Copy-paste scripts organized by scenario. Replace [brackets] with actual values. When clients ask questions, answer DIRECTLY and SUCCINCTLY - don't add information they didn't ask for.

Setting Budget Expectations

For overnight bots we have a \$2K budget for holding \$300K MC. Setting a \$1.5K budget for holding \$250K MC and then a \$1K budget for \$200K MC.

Daily Operations

Setup + First Day Fee

Just withdrew \$3K worth of \$[TOKEN] for MM setup and first 24h of trading. Moving forward for day trading + overnight bots will be \$1K/day

Daily Fee Collection

Just withdrew \$[AMOUNT] worth of \$[TOKEN] from MM balance for the past 24h of trading

Limit Orders Set

I set some small limit orders below \$[X]K so we can support or scoop some supply cheap if it ever dips that low

Strategy Updates (Always Attach Chart)

Injection Play

I think we do a fast injection at [TIME], followed by a quick pull back. In case people fomo in we just heavy collect. Just need the candle to close in that [X]M-[Y]M MC range so we don't cook ourselves on the future breakout.

Establishing Floor

There is more sell pressure than buy pressure, so I am guiding this lower to help establish a floor. Ideally, that floor forms a double bottom around the \$[X]K MC level. From there, we can work it higher and build a range between \$[X]K and \$[Y]K MC.

Retracement

For now we are going to try to collect some back here. Down to [X]M MC and then possibly [Y]M MC, which would be a 23.6% retracement on the previous run up.

Bounce Play

Let's light collect and paint back up from [X]M MC. See if any organic comes in from a bounce at our previous top.

Answering Client Questions

Q: What mechanisms do we have to maintain a healthy chart and avoid bad sentiment?

A: How we protect the chart:

- 24/7 trading coverage (bots + traders are never offline)

- Custom limit-order and price protection mechanisms that adjust based on treasury health (the bigger your treasury, the more buy walls we can set to protect specific levels)
- Budgeted counter-trades that eat directly into sells of a specific size so we show support on meaningful dips

End of Campaign / Cashout

Detailed Breakdown

Final MM Balance: \$[X]K / [X] SOL

10% MM Liq Fee: \$[X]K / [X] SOL

Launch Fee: \$[X]K / [X] SOL

Client Initials: \$[X]K / [X] SOL

Total Cashout After Initials + Fees: [X] SOL

Simple Version

Total Cashout: [X] SOL | 10% MM + Dev Cut: [X] SOL | Total Fee: [X] SOL | Total

Post-Fee Cashout: [X] SOL

14. Trader Shift Protocol

This section is referenced from: Phase 4 (Active Trading) - Daily Operations and Shift Handoff

On-Shift Requirements

MANDATORY: Chart open at ALL times. In VC at ALL times while on trader shift.

- Constantly verify everything is 100% dialed in
- Monitor for failed counter trades
- Check that bots are running continuously
- Check wallet SOL balances
- Respond to client questions promptly
- Try things fast, ask for help when needed

Shift Handoff Checklist

1. Notify client about current chart state
2. Document current bot settings
3. Note any issues or things to watch

4. Provide info for the off period
5. Confirm next trader is ready

→ [See: Section 13: Client Communications Templates](#) — for availability notification messages

Common Mistakes to Avoid

Mistake	Prevention
Bots stopped for extended periods	Set alerts, check regularly
Wallets run out of SOL	Check balances each shift
Counter trading own wallets	Add all tertiary wallets
Slow client communication	Prioritize client questions
Trading without a strategy	Always have and communicate strategy

→ [See: Section 5: Incident Response Protocol](#) — when mistakes happen, follow the protocol

15. TG Bot Commands Quick Reference

Command	Description
/setup <project_id>	Link chat to project
/link_notifications	Set up notification channel
/balance	Show treasury balance
/volume	Organic vs MM volume breakdown
/categories	Wallet categories and stats
/label	Add/edit wallet label
/health	Treasury health check

PART IV: QUICK REFERENCE

16. Checklists

Launch Day Checklist

PRE-LAUNCH (30 min before)

- ☐ Team launch call with client
- ☐ Confirm deploy timing
- ☐ Get CA ready, Pool ID (if pumpfun can derive it before launch, meteora will have it when LP is added)
- ☐ Load seller wallets into Phantom (use higher-numbered sellers)
- ☐ Pre-launch Peanuts setup complete

LAUNCH

- ☐ Deploy token + execute bundle
- ☐ Trading software profile started
- ☐ Begin wash, communicate ETA
- ☐ Clip supply into launch volume (never below bundle price)
- ☐ All tertiary wallets added to exclusion list
- ☐ Counter-trading bots activated
- ☐ Target strategies activated
- ☐ Dashboard setup complete
- ☐ Notification channel linked
- ☐ All wallets labeled
- ☐ Balance check script run
- ☐ Starting balance pinned in chat
- ☐ Comms with client that everything is active

→ [See: Section 8: Phase 3: Launch Execution](#) — for detailed step-by-step launch procedures
